Welcome to the documentation for version v1.1.0.

LwJSON is a generic JSON parser library optimized for embedded systems.

*Download library* *Getting started* [Open](#) [Github](#) [Donate](#)

---

**CHAPTER  
ONE**

---

**FEATURES**

- Written in ANSI C99, compatible with `size_t` for size data types
- RFC 4627 compliant
- Based on static token allocation with optional application dynamic pre-allocation
- No recursion during parse operation
- Re-entrant functions
- Zero-copy, no `malloc` or `free` functions used
- Advanced find algorithm for tokens
- Test coverage is available
- User friendly MIT license

---

**CHAPTER  
TWO**

---

**REQUIREMENTS**

- C compiler

---

CHAPTER  
**THREE**

---

## **CONTRIBUTE**

Fresh contributions are always welcome. Simple instructions to proceed:

1. Fork Github repository
2. Respect [C style & coding rules](#) used by the library
3. Create a pull request to `develop` branch with new features or bug fixes

Alternatively you may:

1. Report a bug
2. Ask for a feature request

## EXAMPLE CODE

Listing 1: Example code

```
1 #include <stdio.h>
2 #include "lwjson/lwjson.h"
3
4 /* LwJSON instance and tokens */
5 static lwjson_token_t tokens[128];
6 static lwjson_t lwjson;
7
8 /* Parse JSON */
9 void
10 example_minimal_run(void) {
11     lwjson_init(&lwjson, tokens, LWJSON_ARRAYSIZE(tokens));
12     if (lwjson_parse(&lwjson, "{\"mykey\":\"myvalue\"}") == lwjsonOK) {
13         const lwjson_token_t* t;
14         printf("JSON parsed..\r\n");
15
16         /* Find custom key in JSON */
17         if ((t = lwjson_find(&lwjson, "mykey")) != NULL) {
18             printf("Key found with data type: %d\r\n", (int)t->type);
19         }
20     }
21 }
```

## TABLE OF CONTENTS

### 6.1 Getting started

#### 6.1.1 Download library

Library is primarily hosted on [Github](#).

- Download latest release from [releases area](#) on Github
- Clone *develop* branch for latest development

#### Download from releases

All releases are available on Github releases area.

#### Clone from Github

##### First-time clone

- Download and install `git` if not already
- Open console and navigate to path in the system to clone repository to. Use command `cd your_path`
- Clone repository with one of available 3 options
  - Run `git clone --recurse-submodules https://github.com/MaJerle/lwjson` command to clone entire repository, including submodules
  - Run `git clone --recurse-submodules --branch develop https://github.com/MaJerle/lwjson` to clone *development* branch, including submodules
  - Run `git clone --recurse-submodules --branch master https://github.com/MaJerle/lwjson` to clone *latest stable* branch, including submodules
- Navigate to `examples` directory and run favourite example

## Update cloned to latest version

- Open console and navigate to path in the system where your resources repository is. Use command `cd your_path`
- Run `git pull origin master --recurse-submodules` command to pull latest changes and to fetch latest changes from submodules
- Run `git submodule foreach git pull origin master` to update & merge all submodules

---

**Note:** This is preferred option to use when you want to evaluate library and run prepared examples. Repository consists of multiple submodules which can be automatically downloaded when cloning and pulling changes from root repository.

---

### 6.1.2 Add library to project

At this point it is assumed that you have successfully download library, either cloned it or from releases page.

- Copy `lwjson` folder to your project
- Add `lwjson/src/include` folder to *include path* of your toolchain
- Add source files from `lwjson/src/` folder to toolchain build
- Copy `lwjson/src/include/lwjson/lwjson_opts_template.h` to project folder and rename it to `lwjson_opts.h`
- Build the project

### 6.1.3 Configuration file

Library comes with template config file, which can be modified according to needs. This file shall be named `lwjson_opts.h` and its default template looks like the one below.

---

**Note:** Default configuration template file location: `lwjson/src/include/lwjson/lwjson_opts_template.h`. File must be renamed to `lwjson_opts.h` first and then copied to the project directory (or simply renamed in-place) where compiler include paths have access to it by using `#include "lwjson_opts.h"`.

---

---

**Tip:** Check *Configuration* section for possible configuration settings

---

Listing 1: Template options file

```
1  /**
2   * \file           lwjson_opts_template.h
3   * \brief          Template config file
4   */
5
6  /*
7   * Copyright (c) 2020 Tilen MAJERLE
8   *
```

(continues on next page)

(continued from previous page)

```

9  * Permission is hereby granted, free of charge, to any person
10 * obtaining a copy of this software and associated documentation
11 * files (the "Software"), to deal in the Software without restriction,
12 * including without limitation the rights to use, copy, modify, merge,
13 * publish, distribute, sublicense, and/or sell copies of the Software,
14 * and to permit persons to whom the Software is furnished to do so,
15 * subject to the following conditions:
16 *
17 * The above copyright notice and this permission notice shall be
18 * included in all copies or substantial portions of the Software.
19 *
20 * THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND,
21 * EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES
22 * OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE
23 * AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT
24 * HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY,
25 * WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING
26 * FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR
27 * OTHER DEALINGS IN THE SOFTWARE.
28 *
29 * This file is part of LwJSON - Lightweight JSON format parser.
30 *
31 * Author: Tilen MAJERLE <tilen@majerle.eu>
32 * Version: v1.1.0
33 */
34 #ifndef LWJSON_HDR_OPTS_H
35 #define LWJSON_HDR_OPTS_H
36
37 /* Rename this file to "lwjson_opts.h" for your application */
38
39 /*
40 * Open "include/lwjson/lwjson_opt.h" and
41 * copy & replace here settings you want to change values
42 */
43
44 #endif /* LWJSON_HDR_OPTS_H */

```

### 6.1.4 Minimal example code

Run below example to test and verify library

Listing 2: Minimal example code

```

1 #include <stdio.h>
2 #include "lwjson/lwjson.h"
3
4 /* LwJSON instance and tokens */
5 static lwjson_token_t tokens[128];
6 static lwjson_t lwjson;
7
8 /* Parse JSON */
9 void
10 example_minimal_run(void) {
11     lwjson_init(&lwjson, tokens, LWJSON_ARRAYSIZE(tokens));
12     if (lwjson_parse(&lwjson, "{\"mykey\":\"myvalue\"}) == lwjsonOK) {

```

(continues on next page)

(continued from previous page)

```

13     const lwjson_token_t* t;
14     printf("JSON parsed..\r\n");
15
16     /* Find custom key in JSON */
17     if ((t = lwjson_find(&lwjson, "mykey")) != NULL) {
18         printf("Key found with data type: %d\r\n", (int)t->type);
19     }
20 }
21 }
```

## 6.2 User manual

### 6.2.1 How it works

LwJSON fully complies with *RFC 4627* memo.

LwJSON accepts input string formatted as JSON as per *RFC 4627*. Library parses each character and creates list of tokens that are understood by C language for easier further processing.

When JSON is successfully parsed, there are several tokens used, one for each JSON data type. Each token consists of:

- Token type
- Token parameter name (*key*) and its length
- Token value or pointer to first child (in case of *object* or *array* types)

As an example, JSON text `{"mykey": "myvalue"}` will be parsed into 2 tokens:

- First token is the opening bracket and has type *object* as it holds children tokens
- Second token has name `"mykey"`, its type is *string* and value is `myvalue`

**Warning:** When JSON input string is parsed, create tokens use input string as a reference. This means that until JSON parsed tokens are being used, original text must stay as-is.

### 6.2.2 Token design

Every element of LwJSON is a token. There are different set of token types:

- *Object*: Type that has nested key-value pairs, eg `{"key": {"sub-key": "value"}}`
- *Array*: Type that holds nested values, eg `{"key": [1, 2, 3, 4, 5]}`
- *String*: Regular string, quoted sequence of characters, eg `{"key": "my_string"}`
- *Number*: Integer or real number, eg `{"intnum": 123, "realnum": 4.3}`
- *Boolean true*: Boolean type true, eg `{"key": true}`
- *Boolean false*: Boolean type false, eg `{"key": false}`
- *Null*: Null indicator, eg `{"key": null}`

When parsed, input string is not copied to token, every token uses input string as a reference and points to the beginning of strings/values. This is valid for all string data types and for parameter names.

---

**Note:** Input string is not modified therefore all strings contain additional parameter with string length.

---

### 6.2.3 Access to data

Once application successfully parses input JSON string, LwJSON creates set of tokens in hierarchical order with tree for children tokens.

To simplify data extraction and to quickly find/access-to given object and token, LwJSON implements simple *find* algorithm based on path formatting.

#### Traverse object

Valid JSON input starts with *object* {} or *array* []. Anything else is invalid JSON object. When `lwjson_parse()` successfully processes input data, application may access JSON tokens with simple loop. Every token is part of linked list and has *tree* organization for children objects.

---

**Note:** Children objects are only available for *object* and *array* types

---

To traverse through all elements, application must first get top object. It can then loop through all in linked list until it reaches zero.

If the token type is *object* or *array*, application must check children nodes for more token data.

Listing 3: Traverse through all tokens

```

1 #include <stdio.h>
2 #include "lwjson/lwjson.h"
3
4 /* LwJSON instance and tokens */
5 static lwjson_token_t tokens[128];
6 static lwjson_t lwjson;
7
8 /* Parse JSON */
9 void
10 example_traverse_run(void) {
11     lwjson_init(&lwjson, tokens, LWJSON_ARRAYSIZE(tokens));
12     if (lwjson_parse(&lwjson, "{\"mykey\":\"myvalue\", \"num\":1, \"obj\":{}, \"arr\":[1,
13     ↪2,3,4]}") == lwjsonOK) {
14         lwjson_token_t* t;
15         printf("JSON parsed..\r\n");
16
17         /* Get very first token as top object */
18         t = lwjson_get_first_token(&lwjson);
19         if (t->type == LWJSON_TYPE_ARRAY) {
20             printf("JSON starts with array..\r\n");
21         } else if (t->type == LWJSON_TYPE_OBJECT) {
22             printf("JSON starts with object..\r\n");
23         } else {
24             printf("This should never happen..\r\n");
25         }
26     }
27 }
```

(continues on next page)

(continued from previous page)

```

25     /* Now print all keys in the object */
26     for (const lwjson_token_t* tkn = lwjson_get_first_child(t); tkn != NULL; tkn_
27     ↪= tkn->next) {
28         printf("Token: %.*s", (int)tkn->token_name_len, tkn->token_name);
29         if (tkn->type == LWJSON_TYPE_ARRAY || tkn->type == LWJSON_TYPE_OBJECT) {
30             printf(": Token is array or object...check children tokens if any, in_
31     ↪recursive mode..");
32             /* Get first child of token */
33             //lwjson_get_first_child(tkn);
34         }
35         printf("\n");
36     }
37 }
```

**Tip:** Check `lwjson_print_json()` to print data on stream output

## Find token in JSON tree

Instead of manually traversing through all tokens, LwJSON implements simple search algorithm to quickly get token from application standpoint.

Let's consider following JSON as input:

```
{
    "name": "John",
    "born": {
        "city": "Munich",
        "year": 1993
    }
    "cars": [
        {
            "brand": "Porsche",
            "year": 2018
        },
        {
            "brand": "Range",
            "year": 2020,
            "crashed": 1
        }
    ]
}
```

There is one *John*, born in *Munich* in 1993 and has 2 cars, *Porsche* and *Range*.

- name is string with value *John*
- born is object with 2 fields
- cars is array of 2 objects
  - object 1
    - \* brand is set to *Porsche*

- \* year is set to 2018
- object 2
  - \* brand is set to Range
  - \* year is set to 2020
  - \* repainted is set to true as this car was recently repainted

To find the person's name, application must first name key and print its value. This can be done by scanning entire object and check which token matches name keyword.

LwJSON implements *find* functionality to find the token in simple way. This is done by providing full path to token in JSON tree, separated by *dot* . character.

To find person name, application would then simply call `lwjson_find()` and pass name as path parameter. If token exists, function will return handle of the token where application can print its value.

If application is interested in *city of birth*, it will set path as `born.city` and search algorithm will:

- First search for `born` token and check if it is *object*
- It will enter the object and search for `city` token and return it on match
- It will return `NULL` of object is not found

**Tip:** Application shall use `lwjson_find()` to get the token based on input path.

When JSON contains arrays (these do not have keys), special character # may be used, indicating *any* element in array to be checked until first match is found.

- `cars.#.brand` will return first token matching path, the one with string value `Porsche` in first object
- `cars.#.repainted` will return first token matching path, the one with boolean value `true` in second object

In first case, `brand` keyword exists already in first object, so find function will get the match immediately. Because in second case, `repainted` only exists in second object, function will return value from second object.

## Access array index

It is possible to access specific array index by adding decimal number after hash character, in format `# [0-9] +`

- `cars.#0.brand` will return `brand` token from *first* object in array (`index = 0`) with value set to `Porsche`
- `cars.#1.brand` will return `brand` token from *second* object in array (`index = 1`) with value set to `Range`

To retrieve full object of the array, application may only apply `# [0..9] +` in search pattern.

- `cars.#0` will return first object token in array
- `cars.#1` will return second object token in array
- `cars.#` will return error as there is no valid index. Use `cars` to retrieve full array

**Warning:** Passing path in format `path.to.cars.#` (hashtag as last element without index number) will always return `NULL` as this is considered invalid path. To retrieve full array, pass path to array `path.to.cars` only, without trailing `#`.

## 6.3 API reference

List of all the modules:

### 6.3.1 LwJSON

#### group **LWJSON**

LwJSON - Lightweight JSON format parser.

#### Defines

##### **LWJSON\_ARRAYSIZE** (*x*)

Get size of statically allocated array.

**Return** Number of elements in array

#### Parameters

- [in] *x*: Object to get array size of

##### **lwjson\_get\_tokens\_used** (*lw*)

Get number of tokens used to parse JSON.

**Return** Number of tokens used to parse JSON

#### Parameters

- [in] *lw*: Pointer to LwJSON instance

##### **lwjson\_get\_first\_token** (*lw*)

Get top token on a list.

**Return** Pointer to first token

#### Parameters

- [in] *lw*: Pointer to LwJSON instance

##### **lwjson\_get\_val\_int** (*token*)

Get token value for *LWJSON\_TYPE\_NUM\_INT* type.

**Return** Int number if type is integer, 0 otherwise

#### Parameters

- [in] *token*: token with integer type

##### **lwjson\_get\_val\_real** (*token*)

Get token value for *LWJSON\_TYPE\_NUM\_REAL* type.

**Return** Real number if type is real, 0 otherwise

#### Parameters

- [in] *token*: token with real type

---

**lwjson\_get\_first\_child(token)**  
Get for child token for *LWJSON\_TYPE\_OBJECT* or *LWJSON\_TYPE\_ARRAY* types.

**Return** Pointer to first child

**Parameters**

- [in] token: token with integer type

## Typedefs

**typedef LWJSON\_CFG\_REAL\_TYPE lwjson\_real\_t**  
Real data type.

**typedef LWJSON\_CFG\_INT\_TYPE lwjson\_int\_t**  
Integer data type.

## Enums

**enum lwjson\_type\_t**  
List of supported JSON types.

*Values:*

**enumerator LWJSON\_TYPE\_STRING**  
String/Text format. Everything that has beginning and ending quote character

**enumerator LWJSON\_TYPE\_NUM\_INT**  
Number type for integer

**enumerator LWJSON\_TYPE\_NUM\_REAL**  
Number type for real number

**enumerator LWJSON\_TYPE\_OBJECT**  
Object data type

**enumerator LWJSON\_TYPE\_ARRAY**  
Array data type

**enumerator LWJSON\_TYPE\_TRUE**  
True boolean value

**enumerator LWJSON\_TYPE\_FALSE**  
False boolean value

**enumerator LWJSON\_TYPE\_NULL**  
Null value

**enum lwjsonr\_t**  
JSON result enumeration.

*Values:*

**enumerator lwjsonOK**  
Function returns successfully

**enumerator lwjsonERR**

**enumerator lwjsonERRJSON**  
Error JSON format

```
enumerator lwjsonERRMEM
Memory error
```

### Functions

`lwjsonr_t lwjson_init (lwjson_t *lw, lwjson_token_t *tokens, size_t tokens_len)`  
Setup LwJSON instance for parsing JSON strings.

**Return** `lwjsonOK` on success, member of `lwjsonr_t` otherwise

#### Parameters

- [inout] `lw`: LwJSON instance
- [in] `tokens`: Pointer to array of tokens used for parsing
- [in] `tokens_len`: Number of tokens

`lwjsonr_t lwjson_parse (lwjson_t *lw, const char *json_str)`  
Parse input JSON format JSON format must be complete and must comply with RFC4627.

**Return** `lwjsonOK` on success, member of `lwjsonr_t` otherwise

#### Parameters

- [inout] `lw`: LwJSON instance
- [in] `json_str`: JSON string to parse

`lwjsonr_t lwjson_reset (lwjson_t *lw)`  
Reset token instances and prepare for new parsing.

**Return** `lwjsonOK` on success, member of `lwjsonr_t` otherwise

#### Parameters

- [inout] `lw`: LwJSON instance

`const lwjson_token_t *lwjson_find (lwjson_t *lw, const char *path)`

Find first match in the given path for JSON entry JSON must be valid and parsed with `lwjson_parse` function.

**Return** Pointer to found token on success, NULL if token cannot be found

#### Parameters

- [in] `lw`: JSON instance with parsed JSON string
- [in] `path`: Path with dot-separated entries to search for the JSON key to return

`lwjsonr_t lwjson_free (lwjson_t *lw)`

`void lwjson_print_token (const lwjson_token_t *token)`  
Prints and outputs token data to the stream output.

**Note** This function is not re-entrant

#### Parameters

- [in] `token`: Token to print

---

```
void lwjson_print_json(const lwjson_t *lw)
Prints and outputs full parsed LwJSON instance.
```

**Note** This function is not re-entrant

#### Parameters

- [in] lw: LwJSON instance to print

```
const char *lwjson_get_val_string(lwjson_token_t *token, size_t *str_len)
Get string value from JSON token.
```

**Return** Pointer to string

#### Parameters

- [in] token: Token with string type
- [out] str\_len: Pointer to variable holding length of string

```
struct lwjson_token_t
#include <lwjson.h> JSON token.
```

### Public Members

```
struct lwjson_token *next
Next token on a list

struct lwjson_token *parent
Parent token (think about optimization and remove this one?)

lwjson_type_t type
Token type

const char *token_name
Token name (if exists)

size_t token_name_len
Length of token name (this is needed to support const input strings to parse)

const char *token_value
Value if type is not LWJSON_TYPE_OBJECT or LWJSON_TYPE_ARRAY

size_t token_value_len
Length of token value (this is needed to support const input strings to parse)

struct lwjson_token_t::[anonymous]::[anonymous] str
String data

lwjson_real_t num_real
Real number format

lwjson_int_t num_int
Int number format

struct lwjson_token *first_child
First children object

union lwjson_token_t::[anonymous] u
Union with different data types
```

```
struct lwjson_t  
#include <lwjson.h> LwJSON instance.
```

### Public Members

```
lwjson_token_t *tokens  
    Pointer to array of tokens  
  
size_t tokens_len  
    Size of all tokens  
  
size_t next_free_token_pos  
    Position of next free token instance  
  
lwjson_token_t first_token  
    First token on a list  
  
uint8_t parsed  
    Flag indicating JSON parsing has finished successfully  
  
struct lwjson_t::[anonymous] flags  
    List of flags
```

### 6.3.2 Configuration

This is the default configuration of the middleware. When any of the settings shall be modified, it shall be done in dedicated application config `lwjson_opts.h` file.

---

**Note:** Check [Getting started](#) for guidelines on how to create and use configuration file.

---

```
group LWJSON_OPT  
    LwJSON options.
```

#### Defines

```
LWJSON_CFG_REAL_TYPE  
    Real data type used to parse numbers with floating point number.  
    This is used for numbers in LWJSON_TYPE_NUM_REAL token data type.  
Note Data type must be signed, normally float or double  
  
LWJSON_CFG_INT_TYPE  
    Integer type used to parse numbers.  
    This is used for numbers in LWJSON_TYPE_NUM_INT token data type.  
Note Data type must be signed integer
```
